TiToM

The solutions being discussed by the UN Climate Conference continue to allow big energy consumers to pollute with impunity while paying others to implement projects supposed to capture carbon. They do not address the huge social and ecological debt owed by the industrialized countries to the countries of the Global South. The current food system is responsible for over 32% of the greenhouse gas emissions. At the same time the practices of agri-businesses make millions of small farmers lose their lands and livelihoods. It is unfair to use the benefits that small farmers provide to the environment as an excuse to keep polluting as usual.

## CLIMATE JUSTICE NOW!

In the South forests are cut down and peasants are cleared from their lands so vast monocultures can be planted in order to produce soy, maize and palm to feed European livestock. In factory farms in Europe, overfed animals produce methane and waste, using huge amounts of energy.

## INDUSTRIAL AGRICULTURE IS HEATING UP THE EARTH

The key issue is the concentration of power into the hands of a few powerful profit-driven corporations which are trying to dominate

**SYSTEM CHANGE, NOT CLIMATE CHANGE!**

the world's food production and distribution systems. This imbalance has been created through food and agriculture policies which promote trade liberalisation and the globalisation of the food economy for the profit of the few.

## TRANSNATIONAL AGRIBUSINESSES HAVE NO PLACE IN OUR FUTURE!

We want to transform the current damaging and highly exploitative food system, and create a pattern of food production based on the needs and rights of local communities rather than exploitation and greed.

## FOOD SOVEREIGNTY NOW

Small scale sustainable farming remains the best way to combat hunger, malnutrition and the current food and climate crises, while native seeds provide the capacity to adapt to the climatic changes already upon us

## SUSTAINABLE PEASANT FARMING COOLS THE PLANET

The UNFCCC has failed to question the current economic model based on infinite growth on a finite planet - We do not expect solutions from those who created the problems in the first place.
